Comparative Growth Intelligence — Nicolas Finet vs Michel Lieben

Independent audits compared on normalised metrics. Metrics are never pooled across accounts. Algorithm repository xai-org/x-algorithm@07d159b.

1. Normalised performance

Metric	@nifinet	@MichLieben
Followers (snapshot)	11,613	13,338
Median views per authored post (90d)	1,183	4,091
Median views per 1k followers (90d)	101.9	306.7
Engagements per 1k views	9.2	16.5
Likes per 1k views	4.16	5.71
Replies per 1k views	0.93	0.98
Bookmarks per 1k views	2.14	8.76
Authored posts per week	6.3	12.0
Share of output as X Articles (90d)	14%	33%
X Article median vs other formats	15.12	1.91
Reach trend per 30 days (multiplier)	0.92	0.83
Share of views from top 5% posts	96%	47%
3rd+ same-day post vs baseline	0.23	0.60

- Normalised metrics use views per 1,000 followers and engagement per 1,000 views; follower counts are a single 2026-10-23 snapshot.
- The two accounts interact heavily (each is among the other's most-replied-to accounts), so their audiences overlap; transferability is judged per account, never by pooling metrics.

2. Shared issues (supported for both)

Issue	@nifinet	@MichLieben
Commenting is low-depth and concentrated on a small circle	supported	supported
Low conversation generation per impression	supported	supported
Content format drives most of the reach difference	supported	supported
High-volume templated replies (lead-magnet fulfilment)	supported	supported
Weak openings / low-utility structures	supported	mixed
Several authored posts on the same day	supported	supported
Reach trend over the window	mixed	supported

3. Account-specific issues

Issue	@nifinet	@MichLieben
Reach depends on rare breakouts	supported	not_supported
Off-core topics underperform core topics	supported	not_supported

4. Content approaches

@nifinet — strongest and weakest segments

Segment	n	Ratio
format = x_article	30	15.12x
hook_type = how_to	33	8.87x
hook_type = story	8	6.24x
narrative = tutorial	46	6.10x
topic = AI agents & GTM automation	33	4.18x
length_bucket = short (15-49)	24	0.18x
narrative = other	28	0.21x
hook_type = other	24	0.22x
topic = personal & lifestyle	9	0.24x

@MichLieben — strongest and weakest segments

Segment	n	Ratio
narrative = promotion	18	2.68x
length_bucket = very short (<15 words)	130	1.95x
format = x_article	105	1.91x
hook_type = how_to	101	1.70x
topic = LinkedIn & social selling	46	1.40x
format = short_post	10	0.18x
length_bucket = very long (400+)	37	0.46x
format = long_post	45	0.53x
hook_type = contrarian	29	0.67x

5. Commenting behaviour

Metric	@nifinet	@MichLieben
Replies per week (all roles)	16.2	48.0
Conversational comments (mature)	226	88
Lead-magnet fulfilment replies	186	1,140
Median views per comment	47	58
Substantive comment share	37%	33%
Share of comments to top-5 accounts	35%	49%

6. Transferable vs account-specific strategies

From	To	Strategy	Basis
@MichLieben	@nifinet	Reference-style tutorials/playbooks that earn saves (bookmark rate)	bookmarks per 1k views
@MichLieben	@nifinet	Higher X Article cadence	nifinet's own articles already outperform its other formats (15.1x) but make up a smaller share of output

> Transfer is proposed only where the receiving account's own data already shows the mechanism working (e.g. its own articles outperform). Copying a successful post from the other account is not expected to reproduce its performance.

7. Top barriers side by side

@nifinet

1. Content format drives most of the reach difference high
2. Low conversation generation per impression medium
3. Off-core topics underperform core topics medium
4. Reach depends on rare breakouts high
5. Commenting is low-depth and concentrated on a small circle medium

@MichLieben

1. Content format drives most of the reach difference high
2. Reach trend over the window medium
3. Low conversation generation per impression medium
4. Commenting is low-depth and concentrated on a small circle medium
5. Several authored posts on the same day medium
